Introduction

In this project, we create a web page to promote Lyon to tourists. The page should be reachable at http://wsXX.j17web.tw/XX_module_a/ where XX is your seat number.

Description of project and tasks

In this project, you are required to implement the web page design.

There are several sections in the layout:

- Header
- Call-to-Action section
- Map attraction
- Video playback
- Essential information
- Latest Events
- Information tabs
- Contact form
- Footer

For the entire layout, please refer to the layout.png.

Header

The header navigation stick to the top when scrolling.

Call-to-Action section

The next section is a call-to-action section. There is a large cover image in the background. Then there is a call-to-action button center aligned within this section.

The button text and behavior change dynamically depending on whether the user has already created a travel plan.

If no existing plan is found, the button displays text such as “Start Planning” and opens the planning wizard.

If a plan already exists, the button changes to “View My Itinerary” and allows users to view their saved plan.

The call-to-action button has a hover effect that follows the mouse cursor.

Planning Wizard

The Planning Wizard is an interactive, multi-step form that helps users create their personalized travel plan.

No predefined layout is provided — competitors must design and implement the interface using the provided resource files.

The wizard consists of **four steps**, each containing input fields defined in the provided resource files.

Basic validation logic for these fields has already been implemented in the materials.

1. **Travel Dates** — Select a start and end date for the trip.
Date selection and validation logic (for example, ensuring correct order and duration) are provided in the materials.
2. **Interests** — Choose one or more travel interests.
The available options (e.g., History & Heritage, Gastronomy, Art & Design, Nature, Nightlife, Shopping) are defined in the provided resource file.
3. **Budget** — Select one daily budget level from the predefined options (e.g., Budget, Comfort, Premium, Luxury).
These ranges and labels are defined in the resource file.
4. **Group Size** — Enter the number of travelers (between 1 and 10).
The allowed range and related configurations are included in the resource file.

After completion, the wizard generates a travel itinerary object based on user inputs by using the provided resource file.

The competitor must save this itinerary object to localStorage so it can later be displayed in the Itinerary Viewer.

Itinerary Viewer

The Itinerary Viewer is a **modal dialog** (pop-up) that displays the travel plan generated from the provided resource file.

It reads the itinerary data from localStorage (as saved by the competitor) and presents it in a clear and structured layout.

The viewer should include the following sections:

A. Trip Details

This section shows key information about the generated plan, including:

- **Dates** — for example: “Wednesday 8 October to Thursday 9 October”
- **Group** — for example: “10 people”
- **Daily budget** — for example: “750 EUR per day”

B. Daily Itinerary

For each day in the itinerary, list the planned activities in chronological order.
Each activity should include the following details:

- **Activity name**
- **Time**
- **Duration**
- **Type**
- **Estimated cost**
- **Description**

C. Controls

- A button to **close** the modal
- A button to **delete the itinerary**, which clears all saved data and resets the interface

The layout and style may be freely designed,
but all listed data elements must be visible and clearly formatted for evaluation.

Floating Action Button

A floating action button is fixed at the **bottom-right corner** of the page.
It provides a quick entry point to the trip planning process or to the user’s existing itinerary.

The button has two different states depending on whether the user has an existing plan:

1. When no itinerary exists

- The button label shows “**Plan a trip**”.
- When clicked, a dialog (modal) appears with the **text content already provided in the resource file**.

Example dialog content (provided in materials):

PLAN

Kick off your Lyon journey

No itinerary yet? Let's build a perfect Lyon plan together!

Explore this beautiful French city and uncover its history, food, art, and culture.

[Start planning now] [Maybe later]

- When the user clicks **“Start planning now”**, the page automatically scrolls to the **Call-to-Action section**, where the trip planning process begins.
- When the user clicks **“Maybe later”**, the dialog closes and no further action occurs.

2. When an itinerary exists

- The button label shows **“My itinerary {day}d”**, where **{day}** represents the total number of days in the current trip plan (e.g., “My itinerary 3d”).
- Clicking the button opens the **Itinerary Viewer** modal.

The floating button must remain visible on all main sections of the page. Its appearance and style may be freely designed, but it must clearly indicate its function and correctly switch between the two states.

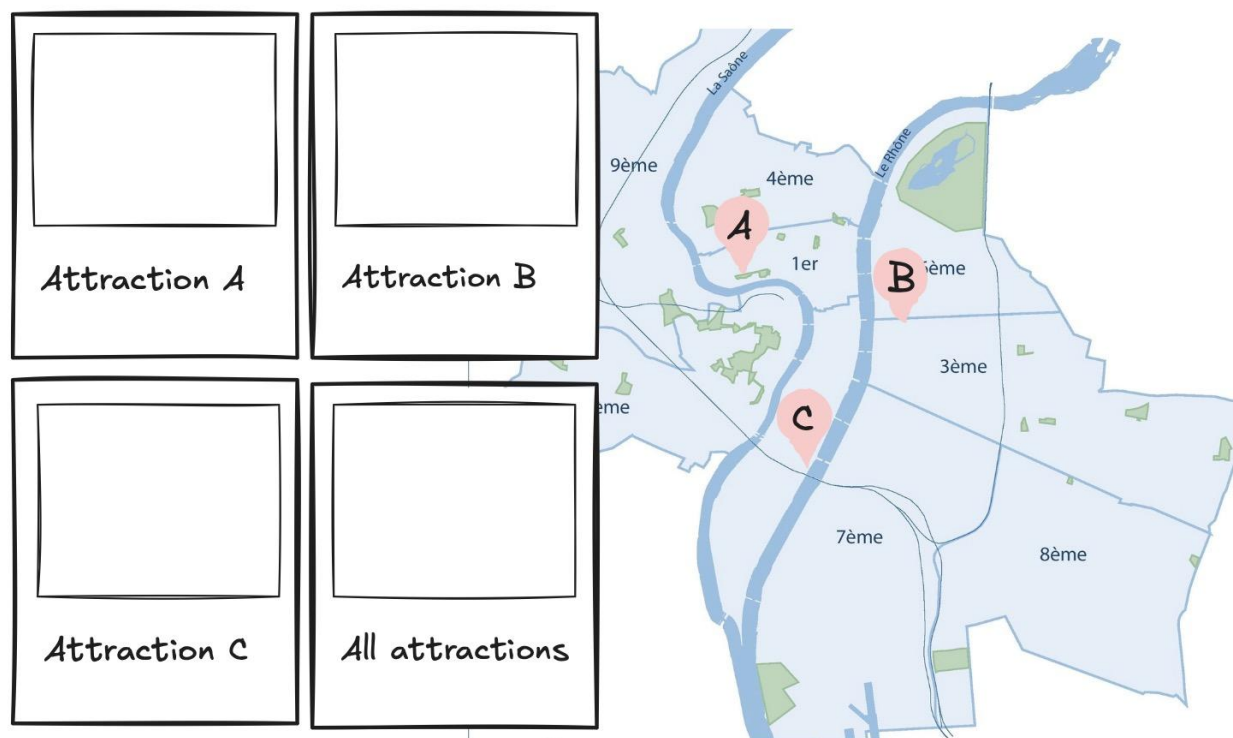

Map attractions

There is a section that display a map (in static image format) on the right and 3 attraction cards are displayed on the left.

The map is static on the right. On top of the map image, there are 3 spots related to the 3 attraction cards on the left. On the left, it is a 2x2 grid, containing 3 attraction card elements that link to the attractions, and the fourth space is a link to all attractions. In this project, it is still a prototype, so we only put an empty URL in these links.

When the mouse hovers over a spot on the map, the corresponding attraction card highlights with a simple focus effect: it slightly scales up (about 1.05x) and shows a soft shadow (5px vertical offset, 5px blur, black at 30% opacity).

When the mouse hovers over an attraction card, the card shows the same focus effect (scale and shadow).

Video playback

After the map section, there is a video section.

Essential information

After the video section, there is an essential information section. There are important contact address and contact phone number.

Latest Events

There are events cards in the Latest events section. The cards aligned horizontally, and it scrolls horizontally when there are more cards than the page width can hold. The cards share the same style of the map attraction cards.

You can find the data of the events in the media file named latest-events.txt, and the images are in latest-events-images folder.

Other Information Tabs

After the latest events, there is a section to show miscellaneous information. The information is group into tabs. You may find the text data in the media file named other-information-tabs.txt.

The tab toggling is done by either mouse clicking, or by using left and right keyboard for tab switching when tabs are in focus.

Contact form

There is contact form with the given fields.

Fields

- First name
- Last name
- Contact Email Address
- Contact Phone Number

Please implement the contact form according to the layout in media files. These fields should be in logical tab index.

In this project, the form is a placeholder and please put empty URL to the form action.

Footer

The footer is a common multiple columns footer. Please follow the layout provided in the media files. You can also find the text content in the media files named footer-content.txt.

Images Loading Responsiveness

Then web page loads the provided low-resolution image files when the screen is less than 760px width.

When the screen width is at least 760px width, large resolution images are used.

Instructions to the Competitor

Please consider accessibility when implementing the design. All images should have proper alternatives. All text content should be readable by screen reader.

This project will be assessed in Google Chrome and accessibility to be assessed by NVDA screen reader from NV Access.

This project will be assessed by using Google Chrome web browser.

You may provide a README file for executing guide if necessary.

Marking Summary

	Sub-Criteria	Marks
1	Responsive loading	4.0
2	Video playback	1.0
3	Design and Layout Implementation	9.25
4	Effects	2.5
5	Accessibility	3.0
6	Tabs	2.75
7	Trip Planning and Itinerary Functions	10.5
